| S.No: 1 | Exp. Name: Design a C program which sorts the strings using array of pointers | Date: 2023-04-23 |
|---------|---|------------------|

Aim: Design a C program that sorts the strings using array of pointers.

Sample Input output:

```
Sample Input-Output -1:
Enter the number of strings : 2
Enter string 1: Tanya
Enter string 2: Geet
Before Sorting
Tanya
Geet
Code
Tanya
Geet
Sample Input-Output -2:
Enter the number of strings: 3
Enter string 1: India
Enter string 2: USA
Enter string 3: Japan
Before Sorting
India
USA
Japan
After Sorting
India
Japan
USA
```

Source Code:

```
stringsort.c
```

| S.No: 2 | Exp. Name: Write a C Program to Search a Key element using Linear search Technique | Date: 2023-04-23 |
|---------|--|------------------|

Aim: Write a program to search a key element with in the given array of elements using [Linear search](#) process.

At the time of execution, the program should print the message on the console as:

Enter value of n :

For example, if the user gives the input as:

Enter value of n : 3

Next, the program should print the messages one by one on the console as:

Enter element for a[0] :

Enter element for a[1] :

Enter element for a[2] :

If the user gives the input as:

Enter element for a[0] :

Enter element for a[1] :

Enter element for a[2] :

Then the program should print the result as:

The key element 56 is found at the position 0

If the user gives the input as:

Enter key element :

Then the program should print the result as:

The key element 56 is found at the position 0

Similarly if the key element is given as 25 for the above one dimensional array elements then the program should print the output as The key element 25 is not found in the array.

Fill in the missing code so that it produces the desired result:

| S.No: 5 | Exp. Name: Write a C program to Sort the elements using Insertion Sort technique | Date: 2023-04-30 |
|---------|--|------------------|

Aim:  
Write a program to sort the given elements using [Insertion sort technique](#).

At the time of execution, the program should print the message on the console as

Enter value of n :

For example, if the user gives the input as:

Enter value of n : 3

Next, the program should print the messages one by one on the console as:

Enter element for a[0] :

Enter element for a[1] :

Enter element for a[2] :

If the user gives the input as:

Enter element for a[0] : 22

Enter element for a[1] : 33

Enter element for a[2] : 22

Before sorting the elements in the array are

Value of a[0] = 22

Value of a[1] = 33

Value of a[2] = 22

After sorting the elements in the array are

Value of a[0] = 22

Value of a[1] = 33

Value of a[2] = 22

Fill in the missing code so that it produces the desired result.

| S.No: 6 | Exp. Name: Write a C Program to Sort the elements using Selection Sort - Smallest element method Technique | Date: 2023-04-30 |
|---------|--|------------------|

Aim:  
Write a program to sort the given array elements using [selection sort smallest element method](#).

At the time of execution, the program should print the message on the console as

Enter value of n :

For example, if the user gives the input as:

Enter value of n : 3

Next, the program should print the messages one by one on the console as:

Enter element for a[0] :

Enter element for a[1] :

Enter element for a[2] :

If the user gives the input as:

Enter element for a[0] : 22

Enter element for a[1] : 33

Enter element for a[2] : 22

Before sorting the elements in the array are

Value of a[0] = 22

Value of a[1] = 33

Value of a[2] = 22

After sorting the elements in the array are

Value of a[0] = 22

Value of a[1] = 33

Value of a[2] = 22

Fill in the missing code so that it produces the desired result.

S.No: 12 Exp. Name: Write a C program to sort given elements using Radix sort Date: 2023-05-03

Aim: Write a program to [sort](#) ([Ascending order](#)) the given elements using [radix sort](#) technique.

At the time of execution, the program should print the message on the console as:

Enter array size :

For example, if the user gives the input as:

Enter array size : 5

Next, the program should print the following message on the console as:

Enter 5 elements :

If the user gives the input as:

Enter 5 elements : 34 47 12 45 22

then the program should print the result as:

Before sorting the elements are : 34 47 12 45 22

After sorting the elements are : 12 23 34 45 55

Note: Do use the printf function with a newline character ([\n](#)).

S.No: 23 Exp. Name: Program to insert into BST and traversal using In-order, Pre-order and Post-order Date: 2023-06-11

Aim: Write a program to create a binary search tree of integers and perform the following operations using linked list.

1. Insert a node
2. Inorder traversal
3. Preorder traversal
4. Postorder traversal

Source Code:

```

Srinivas Ramanujan Institute of Technology [ID: 224614078]

**Aim:**

- Write a program to merge two files and stores their contents in another file.  
 >Open a new file **(file1.txt)** in write mode  
 >Write the content onto the file  
 >Close the file  
 >Open another file **(file2.txt)** in write mode  
 >Write the content from first existing file to new file  
 >Close the file  
 >Open another existing file **(file3.txt)** in read mode  
 >Copy its content from existing file to new file  
 >Close the file  
 >Close the merged file  
 >Close the program

Source Code:

Merge.c

```
#include <stdio.h>
void main()
{
    FILE *fp1, *fp2, *fp3;
    char ch;
    int n, length;
    fp1 = fopen("file1.txt", "w");
    fp2 = fopen("file2.txt", "r");
    printf("Enter the text with @ at end :\n");
    while ((ch = getchar()) != '@')
    {
        putchar(ch);
    }
    putchar('\n');
    fp1=fopen(fp3);
    fp3 = fopen("file3.txt", "w");
    fp3 = fopen("file2.txt", "r");
    while ((ch = getchar()) != '@')
    {
        putchar(ch);
    }
    putchar('\n');
    fp1=fopen(fp3);
    fp3 = fopen("file3.txt", "w");
    while ((ch = getchar()) != '@')
    {
        putchar(ch);
    }
    putchar('\n');
    fp1=fopen(fp3);

**S.No: 35 Exp. Name: Write a C program to Count number of Characters, Words and Lines of a given file** Date: 2023-05-13

**Aim:**  
Write a program to count number of characters, words and lines of given text file.  
User should enter the file name in write mode

\* write the content onto the file  
\* close the file  
\* open the file in read mode  
\* read the text from file and find the characters, words and lines count  
\* print the counts of characters, words and lines

\* close the file

\* Source Code:

```

#include<stdio.h>
#include<string.h>
void main()
{
    FILE *fp;
    char ch;
    int charCount = 0, wordCount = 0, lineCount = 0;
    fp = fopen("Demotextfile2.txt", "w");
    printf("Enter the text with @ at end : ");
    while ((ch=getchar())!= '@')
    {
        putch(ch);
    }
    fclose(fp);
    fp=fopen("Demotextfile2.txt", "r");
    do
    {
        if (ch==' ')
            wordCount++;
        else
            charCount++;
        ch=ch+1;
        lineCount++;
    }
    while (ch!=getchar());
    fclose(fp);
    printf("Total characters : %d\n", charCount);
    printf("Total words : %d\n", wordCount);
    printf("Total lines : %d\n", lineCount);
}

S.No: 36 Exp. Name: Linked list Female gender first Date: 2023-06-18

**Aim:**  
Consider a linked list consisting of name of a person and gender as a node. Arrange the linked list using 'Ladies first principle'. You may create new linked lists if necessary.  
Note: Add code at the beginning.

**Source Code:**

```

#include<stdio.h>
#include<stdlib.h>
#include<string.h>
struct Node
{
    int data;
    char name[20];
    char gender;
    struct Node *next;
};
void segregateGender(struct Node **head_ref)
{
    struct Node *end = *head_ref;
    struct Node *prev = NULL;
    struct Node *curr = *head_ref;
    struct Node *temp = *head_ref;
    struct Node *new_head = end;

    while (end->next != NULL)
    {
        end = end->next;
    }

    struct Node *new_head = end;

    while (curr->data >= 84 curr != end)
    {
        if (curr->data >= 84)
        {
            new_head->next = curr;
            curr->next = NULL;
            new_head = new_head->next;
            new_head->next = NULL;
        }
        else
        {
            prev = curr;
            curr = curr->next;
        }
    }

    if (curr->data >= 84)
    {
        new_head->next = curr;
        curr->next = NULL;
        new_head = new_head->next;
        new_head->next = NULL;
    }
}

int main()
{
    struct Node *head = NULL;
    char name[20];
    char gender;
    struct Node *new_node;
    int option;
    printf("Enter data : ");
    scanf("%d", &data);
    printf("Enter name : ");
    gets(name);
    printf("Enter gender : ");
    gets(gender);
    new_node = (struct Node *)malloc(sizeof(struct Node));
    strcpy(new_node->name, name);
    new_node->gender = gender;

                if(pr(ch) < pr(infix[k]))
                {
                    infix[k] = ch;
                }
                else
                {
                    stack[top+1] = ch;
                }
            }
            k++;
        }
        cout << endl;
        cout << "Infix Expression is: " << infix << endl;
    }
}
```

```
{    postfix();
}

Execution Results - All test cases have succeeded!
```

| Test Case - 1        |   |
|----------------------|---|
| <b>User Output</b>   | Enter Postfix expression:<br>A+B<br>Infix expression: A+B         |
| <b>Test Case - 2</b> |   |
| <b>User Output</b>   | Enter Postfix expression:<br>A/B-C/D<br>Infix expression: A-B/C-D |

**Aim:**  
Write a C program to convert a Prefix expression to Infix expression.

**Source Code:**

```
prefixToInfix.c
```

```
#include <cs50.h>
#include <cs50.h>
#include <cs50.h>
#include <cs50.h>
#include <cs50.h>
#include <cs50.h>
char *prefixToInfix(char *str)
{
    char c, *front, *back;
    if((str[0] != ' ') && (str[0] != '\0'))
    {
        return str;
    }
    for(front=0, back=str+strlen(str)-2; front < back; front++, back--)
    {
        if(c == ' ')
        {
            cout << "Input a prefix expression:" << endl;
            start(str, i, m);
            push('*');
            while ((c = str[i++]) != '\0')
            {
                if(c == '+' || c == '-' || c == '*' || c == '/')
                {
                    pr(c);
                    while ((c = str[i++]) != '\0')
                    {
                        if(c == '+' || c == '-' || c == '*' || c == '/')
                        {
                            cout << "Stack Underflow" << endl;
                            exit(1);
                        }
                        else
                        {
                            stack[top+1] = c;
                        }
                    }
